

Plashore Polypropylene Manhole Shutter©

The Plashore manhole shutter has been designed to eliminate cleaning costs which are incurred on traditional steel Manhole Shutters. They comprise of a 6mm Polypropylene sheet which has been formed with 50mm returns on each side, which are then attached to 50mm steel angles. Each panel is fitted with two lifting points.

Polypropylene has self-cleaning properties which prevents the concrete sticking to them, enabling them to be used more frequently without the need for shot-blasting or extensive labour cleaning charges. The panels are lightweight, yet have been sufficiently tested to provide a new dimension in pouring concrete around manhole rings.
